

Technology **That Drives Sales**

Technology Behind Our Powerful Sales Solutions

With some of the best technology team members and strong industry partnerships, Insurance Technologies has always, and will always, provide solutions with the latest technology and capabilities. Insurance Technologies is proud to be a Microsoft Gold, Managed and Insurance Solutions Partner with Gold Application Development competency. Our solutions are compatible with Windows 7, 8+, 10, and are compatible with the most popular web browsers including Internet Explorer, Google Chrome, Safari and Firefox.

Technologies Used Are:

-  **Microsoft .NET 4.0 and 4.6 Framework:** The Microsoft .NET Framework provides Insurance Technologies the tools to develop sophisticated solutions that are high quality, secure and have the flexibility to integrate with other tools and technologies as needed. Microsoft .NET Framework allows our solutions to be used on desktops, Web and on today's mobile technology devices.
-  **Windows Server 2008 R2, 2012 and 2016:** With Microsoft SQL Server, Insurance Technologies provides solutions with close to zero downtime, advanced data management, and data encryption. Microsoft SQL Server is utilized for structured and semi-structured data support. Handheld device users need to be able to synchronize with a main data store when most convenient.
-  **SQL Server 2008 R2 and 2012:** With the use of SQL Server 2008 R2 and 2012, Insurance Technologies can provide solutions with close to zero downtime advanced data database and data management. SQL Server 2008 R2 and 2012 are also utilized for structured and semi-structured data support. Handheld device users need to be able to synchronize with a main data store when most convenient.
-  **ClickOnce (Desktop Deployment):** Insurance Technologies uses ClickOnce deployment technology, which enables the creation of self-updating Windows-based applications that can be installed and run with minimal user interaction, even on a limited-rights machine. Once installed, ClickOnce is used to ensure that the application is updated and to maintain Web service calls for bi-directional synchronization of user data.
-  **In-Force through Web Services Technology:** A variety of administration systems are supported in a single ForeSight implementation by using Web services technologies. Web services are used to retrieve policy data from back-end administration servers. This could be directly to an administration server or to a "broker/middle-man" server that can involve retrieval of data from multiple admin servers depending on the product selected.
-  **HTML5:** By utilizing HTML5, Insurance Technologies applications can support high-quality drawings, charts and animation, and many other types of rich media content demanded by users without relying on 3rd party plugins or apps. HTML5 provides a new SQL-based database API that can be used for storing data locally. This allows for the ability to save structured data client-side using a real SQL database.

Microsoft Partner

Gold Application Development

Insurance Technologies provides sales illustration and e-application solutions to the insurance and financial services industries. Contact us at +1 719.442.6400 or visit us online at www.insurancetechnologies.com to learn more.
